

TECH STACK & TOOLING REVIEW

Aviation Robotics Company — Outbound Motion

Companion to GTM Strategy & Training Enablement Plan — 2025 Engagement

Note: Recreated from memory as a representative work sample. Tool names below are illustrative examples of tool categories, not confirmed vendor endorsements or confidential procurement details.

Purpose & Selection Criteria

The stack was chosen against three constraints specific to a build-and-transfer engagement: every tool had to be maintainable by the internal team after handoff (no dependency on the outside consultant), every tool had to integrate with — not replace — the client's existing telesales infrastructure, and any AI-enabled tool had to have a clearly bounded use case so it sped up research and drafting without ever standing in for a live conversation.

1. Core Stack Overview

Category	Tool Category / Example	Purpose	Post-Handoff Owner
CRM	Existing CRM (e.g. HubSpot / Salesforce-class platform)	Central account, contact, and opportunity system of record; houses ICP scores and fit tiers	Internal RevOps / Sales Ops
Sales Engagement / Cadence	Cadence automation platform (e.g. Outreach / Salesloft-class tool)	Executes the multi-channel cadence templates (call, email, LinkedIn) on schedule	Internal Sales Ops
Data & Account Enrichment	Firmographic/contact data provider (e.g. ZoomInfo / Clearbit-class tool)	Fleet size, compliance certifications, and contact-level data to feed ICP scoring	Internal SDR team
AI Research & Drafting Assistant	LLM-based assistant with an internal prompt library	Pre-call account briefs and first-line email personalization drafts — reviewed and edited by reps before sending	Internal Sales Ops (prompt library maintenance)
Call Intelligence	Call recording & conversation-tagging platform (e.g. Gong / Chorus-class tool)	Records calls for coaching, tags objection patterns for the weekly review process	Sales Manager
Social Prospecting	LinkedIn Sales Navigator or equivalent	Warm-touch sequencing, trigger-event monitoring (expansions, contract awards, leadership changes)	Internal SDR team

2. AI Usage Boundaries

AI tooling was scoped to three specific tasks, consistent with the guardrails described in the GTM Strategy (Section 5). This boundary was treated as non-negotiable throughout the engagement — it's what kept the relationship-first character of the motion intact while still gaining real efficiency.

- Pre-call research: generating a short account brief (fleet size, recent news, compliance status) — cut rep prep time from roughly 25 minutes to under 5.
- Draft personalization: producing a first-line email draft based on the account brief — always reviewed and edited by the rep before sending, never sent unedited.
- Objection-pattern aggregation: summarizing tagged call notes into weekly themes for script iteration — a synthesis aid, not a replacement for the manager's judgment on what to change.

Explicitly out of scope: AI never drafted or sent a message without human review, never conducted or simulated live call conversations, and was never used to make account-fit decisions without a human sign-off on the resulting score.

3. Recommendations for Scaling Beyond the Pilot

- Once the team scales past the initial pilot cohort, revisit data-enrichment tool tiering — most providers price by seat/contact volume, and early-stage usage rarely reflects steady-state cost.
- Expand the AI prompt library gradually, and only after the certifying manager (see Certification Checklist) has signed off that reps understand the review-before-send discipline — scaling AI usage before that discipline is established is the most common way relationship-first outbound quietly drifts into templated, disengaged outreach.
- Revisit call-intelligence tagging taxonomy quarterly as new objection patterns emerge; a taxonomy that isn't maintained becomes noise rather than signal within a couple of quarters.
