

GO-TO-MARKET STRATEGY

Aviation Robotics, Supply Chain & Drone Companies

Prepared for a Multi-Division Aerospace, Drone & Robotics Client Group — 2025 Engagement

Note: This document has been recreated from memory as a representative work sample. Client and entity names have been altered for confidentiality. It is intended to demonstrate documentation style and strategic approach, not to reproduce an exact original deliverable.

Executive Summary

This engagement supported a group of related aviation and industrial companies operating across three business lines: a Supply Chain company serving commercial and defense aircraft OEMs; a Drone company serving commercial UAS operators; and an Aviation Robotics company serving industrial manufacturing clients. Each company sold overlapping MRO-adjacent services — surface refinishing (repainting), fastener removal (defastening), precision drilling, and de-icing system installation/maintenance — but to different buyer profiles, through different sales motions, and with almost no shared outbound infrastructure.

The objective was to build a single, scalable outbound sales motion that could flex across all three companies: a common ICP framework, gatekeeper-aware sequencing for long-cycle industrial buyers, AI-assisted research and personalization layered onto a relationship-first cadence, and a fully documented playbook the internal sales team could run without outside support after a 90-day ramp.

1. Business Context

Company	Core Offering	Primary Buyer
Supply Chain Company	Component repainting, defastening & re-fastening, precision drilling for structural rework	Director of Supply Chain, VP Procurement, MRO Program Managers
Drone Company	Airframe repainting/coating, fastener servicing, de-icing system integration for fixed-wing & multirotor UAS	Fleet Operations Manager, VP Engineering, UAS Program Directors
Aviation Robotics Company	End-effector refinishing, precision drilling for tooling fixtures, de-icing/thermal protection for outdoor-rated units	Director of Manufacturing Ops, Robotics Program Manager, CEO, CFO

2. Ideal Customer Profile (ICP) Framework

Rather than three separate ICPs, we built one segmentation framework with company-specific qualifying layers, so reps could requalify a single account across multiple companies without re-running discovery from scratch.

Criterion	Fit Signal	Weight
Fleet / unit volume	20+ aircraft, UAS units, or robotic cells in active service	High
Compliance exposure	FAA Part 145, DOD contract, or ISO 9001/AS9100 certification requirement	High
Maintenance model	In-house MRO team supplemented by outside vendors (vs. fully outsourced or fully in-house)	Medium

Criterion	Fit Signal	Weight
Growth signal	Recent fleet expansion, new contract award, or facility buildout	Medium
Budget authority location	Procurement or Ops budget holder identifiable at director level or above	High

3. Gatekeeper & Decision-Maker Mapping

Industrial buying committees in this space are gatekeeper-heavy: executive assistants, procurement analysts, and shop-floor supervisors routinely screen vendor outreach before it reaches a director. The motion was built around three entry points per account rather than one:

- Technical entry: shop supervisor or maintenance lead — used to validate service fit and surface unadvertised pain points (e.g., unscheduled downtime from fastener corrosion).
- Procurement entry: sourcing/procurement analyst — used to understand incumbent vendor contracts, renewal timing, and RFP cadence.
- Executive entry: VP/Director level — reserved for warm introduction after technical or procurement validation or used directly when a trigger event (contract award, fleet expansion) justified a direct approach.

Gatekeeper scripting focused on offering something of immediate value (a compliance checklist, a de-icing failure-rate benchmark) rather than requesting time up front — this measurably increased pass-through rates in the pilot cohort.

4. Messaging Pillars by Company

Company	Core Message	Proof Point Used
Supply Chain Company	Reduce unscheduled AOG downtime from corrosion and fastener failure through scheduled refinishing cycles	Case data on turnaround time vs. incumbent vendors
Drone Company	Extend airframe service life and maintain flight certification through coating and de-icing programs built for UAS duty cycles	Field performance data from comparable UAS fleets
Aviation Robotics Company	Minimize unplanned line stoppages from tooling wear via scheduled precision drilling and refinishing	Uptime benchmarks from industrial robotics deployments

5. Outbound Motion & Cadence

A 14-touch, 21-day multi-channel cadence was built per entry point (technical, procurement, executive), blending call, email, and LinkedIn touches. AI was layered in at three specific points, chosen deliberately to speed up research without replacing the relationship-building parts of the call:

- Pre-call research: AI-assisted account briefs pulling fleet size, recent contract awards, and compliance certifications from public filings and news, cutting rep prep time from ~25 minutes to under 5.
- Personalization at scale: AI-drafted first-line email personalization based on the account brief, always reviewed and edited by the rep before sending — never sent unedited.
- Objection-pattern tracking: call notes tagged and aggregated to identify emerging objection themes across the team weekly, feeding back into script iteration.

Live conversations, gatekeeper navigation, and relationship-building remained entirely rep-led; AI was scoped strictly to research and drafting support.

6. Documentation & Internal Enablement

Everything above was delivered as a living playbook rather than a one-time strategy deck, including:

- ICP scoring sheet with weighted criteria (Section 2) usable directly in the CRM.
- Gatekeeper scripts and objection library, organized by entry point and company.
- Call recordings library tagged by scenario, used in weekly team training sessions.
- Cadence templates pre-loaded into the sales engagement platform.
- A certification checklist used to confirm each rep could run the full motion independently before handoff.

7. 90-Day Ramp Plan

Phase	Weeks	Focus	Milestone
Build	1–4	ICP validation, messaging, initial cadence live in pilot segment	First 50 qualified conversations logged
Co-Run	5–8	Full team running cadences with live coaching and weekly script iteration	Rep-led meeting-booked rate at target benchmark
Certify	9–12	Spot-checks only; team operating independently across all three companies	Internal team certified; playbook handed off

8. Results Snapshot

Directional outcomes from the pilot cohort (illustrative figures, representative of the engagement's general shape):

- Gatekeeper pass-through rate improved meaningfully after shifting from time-request openers to value-first openers.
- Rep pre-call prep time cut by roughly 80% after AI-assisted account briefs were introduced.
- Internal team independently runs full cadence across all three companies by end of Week 10.
